Getting Started:

In order to get the best visual results please make sure that your project is set to use the linear color space in: Edit → Project Settings → Player

2021.2.8f1 or above

Unity 2018.2 changed the way crossfading is handled by shaders. As the package has been submitted using Unity 2021.2.8f1 you have to import it in the latest version first. Want to insert a picture from your files or add a shape, text box, or table? You got it! On the Insert tab of the ribbon, just tap the option you need.

Demo:

The included demo lets you explore the prefabs

Models:

There is total 8 different Models. Here is the Poly-count of every single Models:

Name	Triangles	Vertices
RobotEight.fbx	48212709	
RobotFive.fbx	5089	2470
RobotFour.fbx	5760	2859
RobotOne.fbx	32011625	
RobotSeven.fbx	2360	1231
RobotSix.fbx	2550	1251
RobotThree.fbx	2963	1546
RobotTwo.fbx	4068	2395

Textures:

All the Maps are in PNG format Here is the list of textures and their details:

Name	Resolution	Format
Color.png	1024x1024	.png
Grid.png	4096x4096	.png

Rendering:

For better rendering add a Global Volume and use the “Sample Scene Profile” provided in the scenes folder. Be sure to enable Post Processing in the Camera setting.

Optimization:

Trees are expensive to render as leaves usually produce a lot of overdraw putting a lot of pressure on the raster units of the GPU (fill rate) and the memory bandwidth. At least latter can easily be addressed.
